| Method | | | | | |
| For making a small test batch divide weights/tsp by two to receive 50g instead of 100g. Add phase A into a disinfected glass beaker and heat to 176F/80C to melt the ingredients. Add phase B to phase A and stir well. Then add phase C to phase A/B and stir again well. Remove from the heat and pour into a compact case or small pot containers and let cool. If the consistency is too soft add some more of the stearyl palmitate, heat again in the glass beaker until the stearyl palmitate is melted and fill into containers. If too hard add some more of the polyisobutene, reheat stir well and pour into containers. You can also add more color if necessary to make the shade you like. | | | | | |
